The present invention relates to synthetic and isolated translational regulatory elements comprising oligonucleotides having translational enhancing activity, internal ribosome entry site (IRES) activity or translational inhibitory activity. The recombinant nucleic acid molecule of the invention comprises a synthetic translational regulatory element operatively linked to an expressible polynucleotide. The expressible polynucleotide comprises a first cistron encoding a polypeptide that enhances protein stability or cell viability, and a second cistron encoding a polypeptide of interest. The second cistron is operatively linked to the first cistron, and the expressible polynucleotide comprises an IRES element, which is operatively linked to the first cistron, or the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

The present invention relates to a method for the identification of an oligonucleotide with transcriptional/translational regulatory activity an eukaryotic cell. The method involves integrating an oligonucleotide into the genome of an eukaryotic cell so that it is linked to an

Example 7; Page 167-168; 172pp; English.

ö
expressible polynucleotide or contacting the eukaryotic cell with library of vectors, obtained by cloning a library of oligonucleotide into multiple copies of expression vectors comprising polynucleotide, and detecting changes in expression of the polynucleotide. The method is useful for identifying an oligonucleotide having transcriptional or translational activity in a eukaryotic cell. It is also useful for identifying synthetic transcriptional or translational regulatory elements. The transcriptional or translational regulatory elements are
                                                                                                                                                                                                                                                    120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
